

Shell programing- 3

Develop a shell script using command line arguments & user defined variables.

Examples:

1. Program to check whether a file is an ordinary file, directory, readable/writable.

Step 1. First create a new empty file named **first** under tmp directory by **\$touch /tmp/first** command on the command line.

Step 2. Modify its permission by **chmod 775 /tmp/first**.

Step 3. Write a following program in a file named **test**.

```
MYFILE="/tmp/first" #MYFILE is a user defined variable,& it holds a filename
if test -d $MYFILE
then
    echo "This file is a directory!"
elif test -f $MYFILE
then
    echo "This file is an ordinary file!"
    if test -w $MYFILE
    then
        echo "This file is writable too!"
    else
        echo "This file is not writeable"
    fi
fi

if test -r $MYFILE
then
    echo "This file is readable!"
else
    echo "This file is not readable"
fi
fi
```

Step4. Type **chmod +x** test command to assign executable permission to the test file.

Step5. Run the above script by typing **./test** command.

Step6. Observe the output , and check if it shows correct result as:

Output :

This file is an ordinary file!

This file writeable too!

This file is readable!
